**Big Island Mining (AT-03)**

**Project Status**
- **Approved Date:** 1992
- **Project Area:** 3,400 acres
- **Approved Funds:** $7.00 M
- **Total Est. Cost:** $7.00 M
- **Net Benefit After 20 Years:** 1,560 acres
- **Status:** Completed October 1998
- **Project Type:** Dredged Material/Marsh Creation and Hydrologic Restoration
- **PPL #:** 2

**Location**
The project is located west of the lower Atchafalaya River navigation channel in the Atchafalaya River Delta, northwest of Big Island and approximately 19 miles southwest of Morgan City, Louisiana, in St. Mary Parish.

**Problems**
In the newly emergent Atchafalaya Delta, navigation channel development and maintenance created the large spoil island known as Big Island along the upper west bank of the Atchafalaya River Delta channel. Big Island's elevation of more than 20 feet above mean sea level is not conducive to the formation of marsh habitat and consequently has adversely affected delta growth.

**Restoration Strategy**
The project was an opportunity to increase marsh habitat in the northwestern portion of the Atchafalaya Delta. In 1998, over 3.4 million cubic yards of sediment north of Big Island were dredged to create several distributary channels that reestablished water and sediment flows into shallow water areas in the delta. The sediment was strategically placed to mimic natural delta lobe formation at an elevation suitable for marsh growth. Over 922 acres of new habitat were directly created by construction, and the reestablished water and sediment flows are expected to add an additional 2,000 acres over the life of the project.
