Bohemia Mississippi River
Reintroduction (BS-15)

Project Status
Approved Date: 2007  
Project Area: 5,210 acres
Approved Funds: $0.50 M  
Total Est. Cost: $0.50 M
Net Benefit After 20 Years: 637 acres
Status: Engineering and Design
Project Type: Freshwater Diversion
PPL #: 17

Location
The project is located in the Breton Sound basin in Plaquemines Parish along the east bank of the Mississippi River approximately eight to nine miles southeast of Pointe a la Hache, Louisiana, just northeast of, and across the river from, Port Sulfur.

Problems
The proposed project area is characterized by very low wetland loss rates, which may be attributed to the land-building effects of the existing, nearby Bohemia diversion and the seasonal flooding of the Mississippi River, among other things. The proposed project is designed to help offset wetland losses elsewhere in the State by enhancing deltaic growth in the area characterized by lower wetland loss rates.

Restoration Strategy
The project will restore natural delta-building capacity by reintroducing Mississippi River water and sediments into shallow, open water and existing wetlands. This will be achieved through the construction of a diversion with a capacity of approximately 10,000 cubic feet per second. Dredged material from channel improvements will be used to fill in existing oil and gas canals to create an estimated 14 acres of marsh. Three acres of trees will be planted on new spoil banks of the improved diversion channel. Aquatic vegetation in interior marsh ponds and channels is expected to increase naturally. An estimated 640 net acres of marsh will be created over the 20-year life of the project.

Progress to Date
The project is currently in Phase I, Engineering and Design.

This project is on Priority Project List 17.
