Cameron-Creole Freshwater Introduction (CS-49)

Project Status
Approved Date: 2009  Project Area: 22,510 acres
Approved Funds: $21.1 M  Total Est. Cost: $26.7 M
Net Benefit After 20 Years: 218 acres
Status: Planning and Design
Project Type: Freshwater Diversion
PPL #: 18

Location
The project area is located on the east side of Calcasieu Lake and west of Gibbstown Bridge and Highway 27.

Problems
Virtually all of the project area marshes have experienced increased tidal exchange, saltwater intrusion, and reduced freshwater retention resulting from hydrologic changes associated with the Calcasieu Ship Channel and the GIWW. In addition, thousands of acres of marsh were damaged by Hurricane Rita and again, more recently, by Hurricane Ike. Because of man-made alterations to the hydrology, it is unlikely that those marshes will recover without comprehensive restoration efforts. The Cameron-Creole Watershed Project has successfully reduced salinities and increased marsh productivity. However, the area remains disconnected from freshwater, sediments, and nutrients available from the GIWW.

Restoration Strategy
The freshwater introduction project would restore the function, value, and sustainability to approximately 22,510 acres of marsh and open water by improving hydrologic conditions via freshwater input and increasing organic productivity.

Progress to Date
Project has completed the Planning and Design Phase and is currently in construction. The project has been placed out for bid and a construction contract has been selected. Construction is planned to be completed in July of 2021. The planting portion of the project was completed in July 2016.

This project is on Priority Project List 18.
