Brady Canal Hydrologic Restoration (TE-28)

Location
The project is located 21 miles southwest of Houma, Louisiana, in Terrebonne Parish. The project is bounded by Turtle Bayou to the east, Bayou DeCade to the south, and Bayou Penchant to the north.

Problems
The intermediate marshes in the area are highly fragmented and are the transitional areas between the fresh and brackish zones. These marshes are extremely susceptible to erosion and wetland loss. Land loss in the area has been caused by saltwater intrusion, subsidence, and increased tidal energies.

Restoration Strategy
The project measures include replacing and maintaining weirs, constructing a rock plug, stabilizing channel cross-sections, and restoring and maintaining channel banks. These measures will maintain and enhance existing marshes in the project area by reducing the rate of tidal exchange. They will also increase the utilization of sediment and fresh water introduced from the water control structures and overbank flow along the north, east, and west sides of the project area. Along the southern boundary, bank restoration and water control structures are used to reduce tidal flow rate from channels into interior ponds, helping to improve the retention of sediment and fresh water.

Progress to Date
Fina Oil Company and Burlington Resources helped fund the project. Construction was completed in July 2000. A monitoring plan has been developed, and the Louisiana Department of Natural Resources is currently collecting data so that the project’s effectiveness can be evaluated. This project is on Priority Project List 3.
