Prevention of erosion of the Island by a combination of: i) plant cover, ii) material toe structure, iii) sand or gravel toe, iv) permanent flood control levee, and v) construction of dikes.

1. Exact location of all plants shall be determined on site by

2. The top of the smooth concrete and salt grass root area shall be placed within 2.0 F.O.C. (foot of channel) from the edge of the flood plain.

3. The permanent flood control levee shall be placed between 2.0 F.O.C. (foot of channel) from the edge of the flood plain.

4. All distance measurements shown on the plans are approximate.

5. No vegetation may alter the existing conditions of the Island.

6. Contaminant does not maintain and is subject to

Designation of existing vegetation.

All distance measurements shown on the plans are approximate.
