Re: **Breton Landbridge West Marsh Creation Project (BS-0038)**
Geotechnical Engineering Analysis (Phase II)
Plaquemines Parish, Louisiana
APS File No.: 2008-G063

Dear Ms. Diez:

APS Engineering and Testing, LLC is pleased to submit our 95% Preliminary Geotechnical Engineering Report for the above referenced project. The report includes the results of our analysis and recommendations for the proposed four marsh creation areas in Plaquemines Parish, Louisiana.

We appreciate the given opportunity to perform this Geotechnical study and look forward to continue participating during the design and construction phases of this project. If you have any questions pertaining to this report, or if we may be of further service, please contact our office.

Respectfully submitted,
APS ENGINEERING AND TESTING, LLC

Sairam Eddanapudi, M.E., P.E.

1.0 PROJECT INFORMATION

1.1 Project Authorization

APS Engineering and Testing has completed the subsurface exploration for the proposed marsh creation project in Plaquemines Parish, Louisiana. Our geotechnical engineering services were performed in general accordance with our APS Proposal No.:2006-G027.02 dated February 3, 2021. The contract No. 4400018143, "Geotechnical Services for CPRA" Task #2, Amendment #1, was received from Mr. Jerry Carroll, P.E. on February 3, 2021.

1.2 Project Description

History

Historically, this area was nourished by the freshwater delivered by the Mississippi River until the creation of the levees along the lower river. In 1991, the Caernarvon Freshwater Diversion began delivering freshwater to the marshes in the area. The major cause of wetland loss has been from Hurricanes Betsy and Katrina causing both storm-induced scouring and saltwater intrusion. The high subsidence rates range from 2.1-3.5 feet per 100 years. The 1984 to 2016 USGS loss rate is -1.76% per year for the extended boundary area. Many areas of once healthy marsh platforms in *Breton Sound* have converted to open water. Continued marsh loss in this area will affect the overall ecosystem functions within *Breton Sound*.

Project Objective

The primary goal of BS-0038 is to create approximately 326 acres of marsh by hydraulically dredging material from a borrow source located just north of the project area in Grand Lake. The material will be placed in four (4) marsh creation areas formed by constructing earthen containment dikes around the perimeter and nourishing an additional 97 acres of marsh. Three of the marsh creation areas will be stabilized by constructing proposed lakeside dikes that will be constructed with a combination of bucket dredge and marsh buggies. The lakeside slope of the berms will be planted with appropriate vegetation. The borrow area is a 195-acre area in Grand Lake located north of the subject project site.

The following tables show the data provided by the client. All elevations provided in this report are in NAVD88.

TABLE 1.0 Furnished Data

MCA #	Volume (C.Y)	Area (acres)
MCA 1	403,102	126
MCA 2	255,340	73
MCA 3	238,307	81
MCA 4	497,282	157
TOTAL	1,394,031	437

TABLE 2.0 Furnished Data

MCA #	Existing Mud Elevation (ft.)			Water Elevation (ft.)		
	Case I	Case II	Case III	MLW	MHW	Avg.
MCA 1	0	-1.5	-3.0	+0.44	+1.07	+1.0
MCA 2	-0.5	-3.0	-7.0	+0.44	+1.07	+1.0
MCA 3	-0.5	-3.0	-4.5	+0.44	+1.07	+1.0
MCA 4	-0.5	-2.0	-3.0	+0.44	+1.07	+1.0

1. Case I elevations were used in PSDDF analysis.
2. Case II and III were used in ECD
3. and Lake Dike analysis.
4. Average water elevation was used in the PSDDF analysis.
5. MLW and MHW elevations were used in ECD and Lake Dike analysis.

APS has completed the field exploration and associated laboratory testing of obtained soil samples during the first phase of the subject project. A complete Geotechnical Engineering Data Report was submitted on March 3, 2021. This report provides Phase II of the project including geotechnical engineering analysis of the proposed Breton Landbridge Marsh Creation Project as per current CPRA Marsh Creation Design Guidelines.

2.0 SITE GEOLOGY

The area predominantly consists of marsh deposits with organics at the shallow depths. Pleistocene deposits are approximately 200 feet below the existing grade at the project site. Natural levee deposits that may be present along distributary channels typically provide better subsurface soil conditions than marsh deposits.

3.0 SITE CONDITIONS

Based on the information provided by our field exploration crew, the area in general is wide open water areas with some vegetation. The data provided by the client shows that there are NO pipelines running through the proposed MCAs. In general, based on our field explorations the height of water above the mudline across the site varied from one to four feet in the marsh

creation areas. In the borrow areas, the height of water varied from five to seven feet along the perimeter of the site.

4.0 SUBSURFACE SOIL CONDITIONS

The materials encountered at the borrow area exploration are primarily clay with silt and fine sand from the mudline to a depth of about 25 feet. The upper material also consists of peat or organic clay layers.

The Marsh creation area exploration primarily consists of clays with interbedded sand and silt layers of varying thicknesses. The marsh borings were drilled to a maximum depth of 40 feet below the mudline. The marsh area consists of peat and clay with high organic content in the top 2-6 feet from the mudline. The material consistency ranged from very soft to medium stiff to the termination depth of the boring.

SOIL DESIGN PARAMETERS

The peat layers present at the top were highly compressible and have percentage of organics over 30%. The shear strength of the peat layer ranged from 50-100 PSF. The soil design parameters such as shear strength, wet/saturated unit weight and moisture content are presented in tables for each MCA in the APPENDIX C. The key parameters in determining the magnitude of consolidation of foundation soils, such as Pre-consolidation Pressure, Compression Index and Permeability values were determined from one-dimensional consolidation tests performed for each MCA.

The shear strength of normally consolidated soils was plotted along with 22% and 30% of cumulative overburden pressure line against depth. This trend line showed that the subsurface soils at the site are in general, normally consolidated.

5.0 DISCUSSION

Upon review of the existing soil conditions from our subsurface exploration at marsh creation areas and the borrow area, we consider that the proposed project is feasible from a geotechnical point of view. APS has completed the geotechnical analysis in coordination with the design engineers and based on the latest comments received from the client on May 24, 2021.

The selection and documentation of the soil design parameters for the various project features were discussed and approved by CPRA prior to completion of our analyses. Initial soil design parameters were approved by CPRA through correspondence on March 3, 2021. Additional changes were made following the review of our preliminary analyses and were approved during our weekly progress meetings.

The engineering analyses included determination of the total settlement of self-weight of dredged sediment combined with compressibility of underlying subsurface soils over 20-year design life. APS

has estimated the total settlement of the dredge fill and compressible foundation layers using Primary consolidation, Secondary compression, and Desiccation of Dredged Fill (PSDDF) software developed by US Army Corp of Engineers. PSDDF analysis was performed for various fill heights such as 3.75, 4.0, 4.5, 4.75, 5.0 and 5.5 feet of dredge fill material with target elevations in the range of +1.1 over the design life of 20 years. The mud elevations for all MCAs were in the range of -1 to -3.0 (NAVD88). A construction period of 45 days was taken into our calculations.

The initial slope stability analysis was performed for all MCAs with respective mudline elevations of each MCA. These results are attached in the APPENDIX B. A representative Lake Dike and ECD section was chosen, and the analysis was performed with one shearline developed using all the boring data and CPT data across all MCAs. After further review by the client, additional analysis was performed modeling internal as well as external borrow areas for all three cases (A-1, A-2 and B) as outlined in the latest version of CPRA's MCDG.

There were a few areas within MCA 2 and MCA 4 that the mud elevation was much deeper. Therefore, additional slope stability analysis of Lake Dike was performed with mud elevation as deep as -7.0. All three cases are discussed, and results are presented in the following sections of this report.

Please review the following sections for further information on the dredge fill and foundation settlement analysis results along with Lake Dike and Earthen Containment Dike (ECD) slope stability and settlement analysis results.

6.0 GEOTECHNICAL ANALYSIS RESULTS & RECOMMENDATIONS

A total of five soil borings, B-1 through B-5 were performed in the proposed marsh creation areas. The laboratory test data was used to develop the parameters required to perform the PSDDF analysis for each MCA. For each MCA, the foundation soils layers were developed based on the consolidation tests assigned along the depth of marsh creation area soil borings. From these test results, void ratios, and effective stresses along with corresponding permeability values were used in the PSDDF software to determine settlement of dredge fill as well as compressible foundation soils.

Based on our assumptions regarding dredge fill placement rates and properties, our estimates of settlement indicate acceptable performance for a constructed marsh fill elevation (CMFE) of approximately +3.5 feet at the end of construction considering a dredge fill placement rate corresponding to approximately 45 days. The presented elevations in this report assume all flocculate and zone settling is complete.

Based on the information provided by the client the construction period was assumed to be 45 days for all MCAs and the filling will be performed in stages. At each MCA, total fill placement was divided into approximately equal intervals over the construction period.

The recommended ECD/Lake Dike crown elevations will accommodate approximately one foot of freeboard above the constructed marsh fill elevation to allow for additional elevation due to slurry concentration. Our analyses are based on the MCDG requirement of a 5-foot-wide ECD crown having 4H:1V side slopes and assume an approximate bench width of 25 feet from the borrow area. We have assumed the side slope of the borrow channel is approximately 2H:1V and extends from the mudline to elevation -12.0.

A general shearline and compressibility parameters were developed using all the soil boring and CPT data to analyze the ECDs and Lake dikes for all the four MCAs. The ECD and Lake dike for each MCA were analyzed with their respective mud and water elevations. The design parameters are attached in APPENDIX B for review.

6.1 Marsh Creation Area Settlement

As requested by the client, APS has performed settlement analysis of foundation soils along with dredge fill using PSDDF software for all four MCAs. The *Case I of the mud elevations and average water elevations* shown in **TABLE 2.0** were used in the PSDDF analysis. The rainfall details used were from the Climatological Data Publications on NOAA software provided by the client.

The thickness of dredged material in a contained area is reduced by primary consolidation, secondary compression, and desiccation. The low stress consolidation and settling column test results were used to determine input parameters for the dredged fill materials.

In this project, the borrow material is predominantly silt and therefore, consolidation within the dredged fill occurs over a long period of time after the construction. The fill pumping and dewatering techniques will also govern the overall settlement with respect to time.

The sum of the dredge fill settlement and the underlying foundation soil settlement were used to determine the total settlement that will be realized at the surface of the dredged fill area after filling is complete.

The following tables show the consolidation settlement of foundation soils for limited number of time periods for different dredge fill heights. The constructed marsh fill elevation is the estimated elevation of fill at the end of 45 days of construction period. Please refer to the curves attached in the APPENDIX A.

TABLE 3.0 Foundation Soil Consolidation Settlement (feet) due to Dredge Fill

Marsh Creation Area (MCA)	CMF Elevation ¹ (feet)	Existing Mudline Elevation (NAVD 88)	Foundation Soil Settlement (feet)

	+3.25	+2.23	+1.63	+1.46	+1.46	+1.46
	+3.75	+2.57	+1.83	+1.58	+1.57	+1.57

6.2 Lake Dike and ECD Analysis Results & Recommendations

The excavated material will be placed by un-compacted methods for the construction of containment dike and lake dike. The stability analysis assumes that these materials will be excavated and placed by mechanical methods. APS recommends placing an un-compacted dike fill in three-foot lifts. If the depth of standing water is closer to MLW, then consideration should be given to placing an initial fill lift for the entire length of the dike before proceeding to the next lift. This method will initiate consolidation of foundation soils as well as provide a means for the un-compacted fill to provide a sufficient wearing surface. This will also decrease the potential for slope failure within the fill as the dike is constructed.

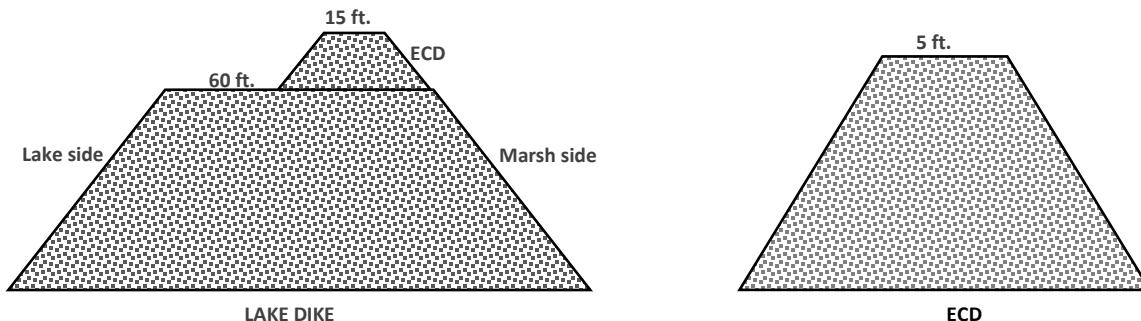

The slope stability and time rate of settlement analysis results of earthen containment dike (ECD) and the lake dike showed that factors of safety are greater than 1.20 as per CPRA guidelines. Therefore, APS believes that constructability of containment dikes is feasible with an approximate freeboard of 12 inches and with a minimum bench width of 25 feet. CPRA requires that five feet offset from the toes of the dike where no equipment is allowed to mitigate.

As requested by the client, APS has completed the settlement and slope stability analysis with Case II mud elevation with MLW and MHW values presented in Table 2.0.

6.2.1 Slope Stability Analysis

A total of five soil borings and 11 CPTs performed in the marsh creation areas were used in the development of soil properties to perform respective containment dike stability and settlement analyses. SLOPE/W software (GeoStudio V. 2016) was used to perform the analysis using *Spencer* method.

A Lake Dike was evaluated with a minimum height of six (6) feet to a maximum height of 11.5 feet as shown in the sketch below. A 1V:4H slope was used for all the lake dikes and containment dikes. Based on our analysis, a minimum bench width of 25 feet between the dike and borrow channel excavated will be sufficient during construction. Table 5.0 shows the properties of dredge fill and containment dike used in the slope stability analysis. The results of slope stability analyses are presented in Table 6.0 and Table 7.0.

The above sketches are for understanding purposes only and NOT TO SCALE.

TABLE 5.0 Properties used in Slope Stability Analyses

Material Properties	For all four MCAs	
	Dredged Fill	Lake Dike/ECD
Unit Weight (pcf)	80	80
Cohesion (psf)	50	50-80

TABLE 6.0 Lake Dike Slope Stability Analysis Results

MCA #	Mud Elevation (ft.)	CMF Elevation (feet)		Factor of Safety		
		Lake Dike	ECD	Case A-1	Case A-2	Case B
1	-1.5	+3.25	+4.25	1.59	2.53	1.91
2	-3.0	+3.5	+4.50	1.42	2.15	1.78
3	-3.0	+3.5	+4.50	1.42	2.15	1.78
4	-2.0	+3.5	+4.50	1.37	2.15	1.85

TABLE 7.0 ECD Slope Stability Analysis Results

MCA #	Mud Elevation (ft.)	ECD CMF Elevation (feet)	Factor of Safety		
			Case A-1	Case A-2	Case B
1	-1.5	+4.25	1.27	2.22	1.27
2	-3.0	+4.50	1.28	2.56	1.28
3	-3.0	+4.50	1.28	2.56	1.28
4	-2.0	+4.25	1.40	1.77	1.39

An MLW of +0.44 and an MHW of +1.07 was used in the slope stability analysis for all four MCAs. A surcharge pressure of 260 PSF was applied due to long reach marsh buggy excavator.

Additional Slope Stability Analysis

Additional analysis was performed at the deeper section as per client's request. Deeper sections were identified for the Lake Dike in MCA 2 and 3. The Soil Properties were developed with the boring and CPTs data confined to their respective MCAs.

TABLE 8.0 Additional Lake Dike Slope Stability Analysis Results

MCA #	Mud Elevation (ft.)	CMF Elevation (feet)		MHW on Lake Side Factor of Safety		MHW on Marsh Side Factor of Safety		Factor of Safety
		Lake Dike	ECD	Case A-1	Case A-2	Case A-1	Case A-2	
Representative	-3.0	+3.50	+4.50	1.25	2.15	1.53	2.16	1.55
2	-6.0	+3.50	+4.50	1.27	2.02	1.52	2.02	1.62
4	-7.0	+3.50	+4.50	1.29	2.24	1.54	2.25	1.66

CASE A-1: A global stability check performed on Lake Dike/ECD with borrow excavation; MHW on opposite side of borrow and MLW on borrow side.

CASE A-2: A local stability check performed on Lake Dike/ECD with borrow excavation subjected to distributed surcharge load of 260 PSF; MLW on borrow side excavation.

CASE B: Stability check with dredged fill placed to CMF elevation with MLW on opposite side of borrow.

Containment dike analyses for all four MCAs met the minimum required factor of safety of 1.20. Based on our analysis, a marsh buggy mounted long reach excavator situated on a bench is suitable to perform the excavation for the lake dike along with containment dike construction.

6.2.2 Settlement Analysis

APS has performed time rate of settlement analysis of lake dike and containment dikes for all four MCAs constructed with respective crown elevations using Settle3D version 4.0 software. The settlement of earthen containment dikes is governed by the following two components.

- Consolidation of underlying soils due to loads from the dike; and
- Shrinkage within the lake dike/containment dike fill material.

Shrinkage of fill material depends mainly on method of construction, weather, and height of fill. It mostly occurs on exterior side of the dike which is relatively exposed more to weather. Shrinkage settlement of dike is approximately 20% of dike height above the water that is exposed to weather. However, the shrinkage settlement may vary with changes in water level over the period of time after construction. A MLW of +0.44 was used to calculate the shrinkage settlement as the scope of work does not include to perform shrinkage limit test and therefore it is the more conservative approach.

TABLE 9.0 Lake Dike Settlement Analysis Results

Marsh Creation Area (MCA)	Lake Dike Elevation (feet)	Estimated Consolidation Settlement of Foundation Soil (Inches)								Settlement due to Shrinkage ^{1,2} (Inches)
		30 days	60 days	90 days	120 days	180 days	Year 1	Year 2	Year 5	
1	+4.25	6.8	10	11.8	12.9	14.5	16	16.6	17.2	6
2	+4.5	9.4	13.5	15.2	16.5	18.2	20	21.1	23.3	6
4	+4.5	3.0	4.0	4.6	5.3	6.3	9.2	11.5	14.5	6

1. Approximate Shrinkage Settlement = (Initial Dike Elevation - MLW) * 0.2

2. Consolidation settlement does not include Shrinkage settlement.

TABLE 10.0 ECD Settlement Analysis Results

Marsh Creation Area (MCA)	ECD Elevation (feet)	Estimated Consolidation Settlement of Foundation Soil (Inches)								Settlement due to Shrinkage ^{1,2} (Inches)
		30 days	60 days	90 days	120 days	180 days	Year 1	Year 2	Year 5	
1	+4.25	7.6	11.6	13.5	14.5	15.9	17.2	17.6	18.0	10
2	+4.50	8.0	10.9	12.4	13.3	14.2	15	15.5	16.3	10
3	+4.50	8.0	10.9	12.4	13.3	14.2	15	15.5	16.3	10
4	+4.50	3.0	3.9	4.5	5.1	6.0	8.8	11.2	13.8	10

1. Approximate Shrinkage Settlement = (Initial Dike Elevation - MLW) * 0.2

2. Consolidation settlement does not include Shrinkage settlement.

6.3 Soil Bearing Capacity

APS has evaluated the ultimate soil bearing capacity of the earthen containment dikes considering a marsh elevation of -3.0. The near-surface material encountered at the site are very weak and are compressible. In order to achieve a bearing capacity factor of safety of at least 1.1 for the proposed containment dikes, an undrained shear strength of approximately 80 PSF would be necessary. The construction of containment dikes in stages will help achieve the required bearing capacity. Our assumptions and calculations regarding bearing capacity are presented in the APPENDIX D.

The volume of material placed will vary along the alignment based on quality of fill material placed, and the exact means and methods of the contractor (e.g., drop height of excavated soils from the side cast, rate of placement of the excavated soils). The near surface soil strength encountered varied. Areas of sufficient soil strength to achieve design grades without bearing capacity failures may exist along the ECD alignment.

6.4 Cut to Fill Ratio

A cut to fill ratio of 1.2 is recommended for this project accounting for the losses due to localized containment dike failures, leaking pipes, and dewatering of the fill sites; although a cut to fill ratio of 0.75 was calculated as shown below. The cut to fill ratios should also account for the losses during transportation of borrow material. Since APS does not have information about the type of equipment used during construction pipe losses during transportation cannot be calculated.

Typically, end of construction void ratio (e_i) obtained from Settling Column Test, was used in determining the cut to fill ratios. However, based on the information from the client, the void ratio of fill material at 20 years was taken into account to calculate the cut to fill ratios. The volume of the soil solids pumped from the borrow area will be estimated by measuring the mud elevations before and after the dredging operations. This method assumes to estimate the volume of solids pumped into the fill area thereby reducing the cut to fill ratios.

TABLE 11.0 CUT TO FILL RATIO

FILL VOLUME (Cubic Yards) (from Table 1.0)	1,394,031
DESIGN LIFE @ 20 YEARS (Days)	7300
SPECIFIC GRAVITY OF DREDGED MATERIAL	2.71
APPROX. INSITU WATER CONTENT OF DREDGED MATERIAL (%)	90
UNIT WEIGHT OF WATER (g/L)	1,000
PERCENT FINES IN DREDGED MATERIAL (%)	99.2
PERCENT SAND IN DREDGED MATERIAL (%)	0.8
SETTLED SOLIDS CONCENTRATION, g/L (C_d) (from settling column test)	582.8
INITIAL VOID RATIO OF HYDRAULIC DREDGE @ 20 YEARS (e_i)	3.65
INSITU VOID RATIO OF SEDIMENT (e_i)	2.44
CALCULATED CUT TO FILL RATIO	0.75
RECOMMENDED CUT TO FILL RATIO	1.2

(From USACE EM-1110-2-5027)

$$e_o = ((G_s \gamma_w)/C_d) - 1$$

$$V_{FINES} = v_i (((e_o - e_i)/(1+ e_i)) + 1)$$

where

$$e_i = w G_s / S_D$$

W = Approximate In-situ moisture content

Obtained from borrow area boring logs

This project proposes to create marsh by dredging sediment from the Grand Lake for placement into the designated four fill sites. Mechanical dredging is primarily based on the expected transport losses during construction, desiccation of the clayey material in the project area, and consolidation of the material under its own weight.

7.0 CONSTRUCTION CONSIDERATIONS

- For Construction of the dikes, a minimum bench width of 25 feet is required for all four Marsh Creation Areas (MCA) between the toe of the dike and start of the excavation. This is based on stability of dike and borrow excavation and minimum room needed for marsh buggy. Marsh buggy long reach excavators used to construct the dikes must stay at least 5 feet away from the edge of the excavation bank. To maintain excavation overall embankment stability, we recommend that marsh buggies remain as close to the dike as practically possible.
- The settlement of foundation soils will be monitored periodically after the construction of containment dikes and placement of dredged fill.
- Changes of water levels can significantly affect construction and the containment dike stability. High water levels may increase erosion, while low water levels may reduce fill buoyancy causing failures.

8.0 REPORT LIMITATIONS

The analyses and recommendations presented in this report are based on the existing field conditions at the time of the investigation. Furthermore, they are based on the assumption that the exploratory borings are a representation of the subsoil conditions throughout the site. Please note that variations in the subsoil conditions may occur between and beyond borings. If variations in those conditions are encountered during construction, APS shall be notified immediately in order to assess the situation, confirm the recommendations included in this report, or modify them according to their own

judgment. If APS is not notified of such variations, APS will not be responsible for the impact of those variations on the project.

Furthermore, this report is based on the design considerations presently known to us. Project designers must be aware of this situation to check if any important design parameter has been overlooked or requires additional clarification. If the nature of the project should change, the recommendations given in this report shall be re-evaluated. If APS is not notified of such changes, APS will not be responsible for the impact of those changes on the project.

The only warranty regarding our services is that the findings, recommendations, specifications, or professional advice contained herein have been made in accordance with the generally accepted professional geotechnical engineering practices in the local area. No other warranties are implied or expressed.

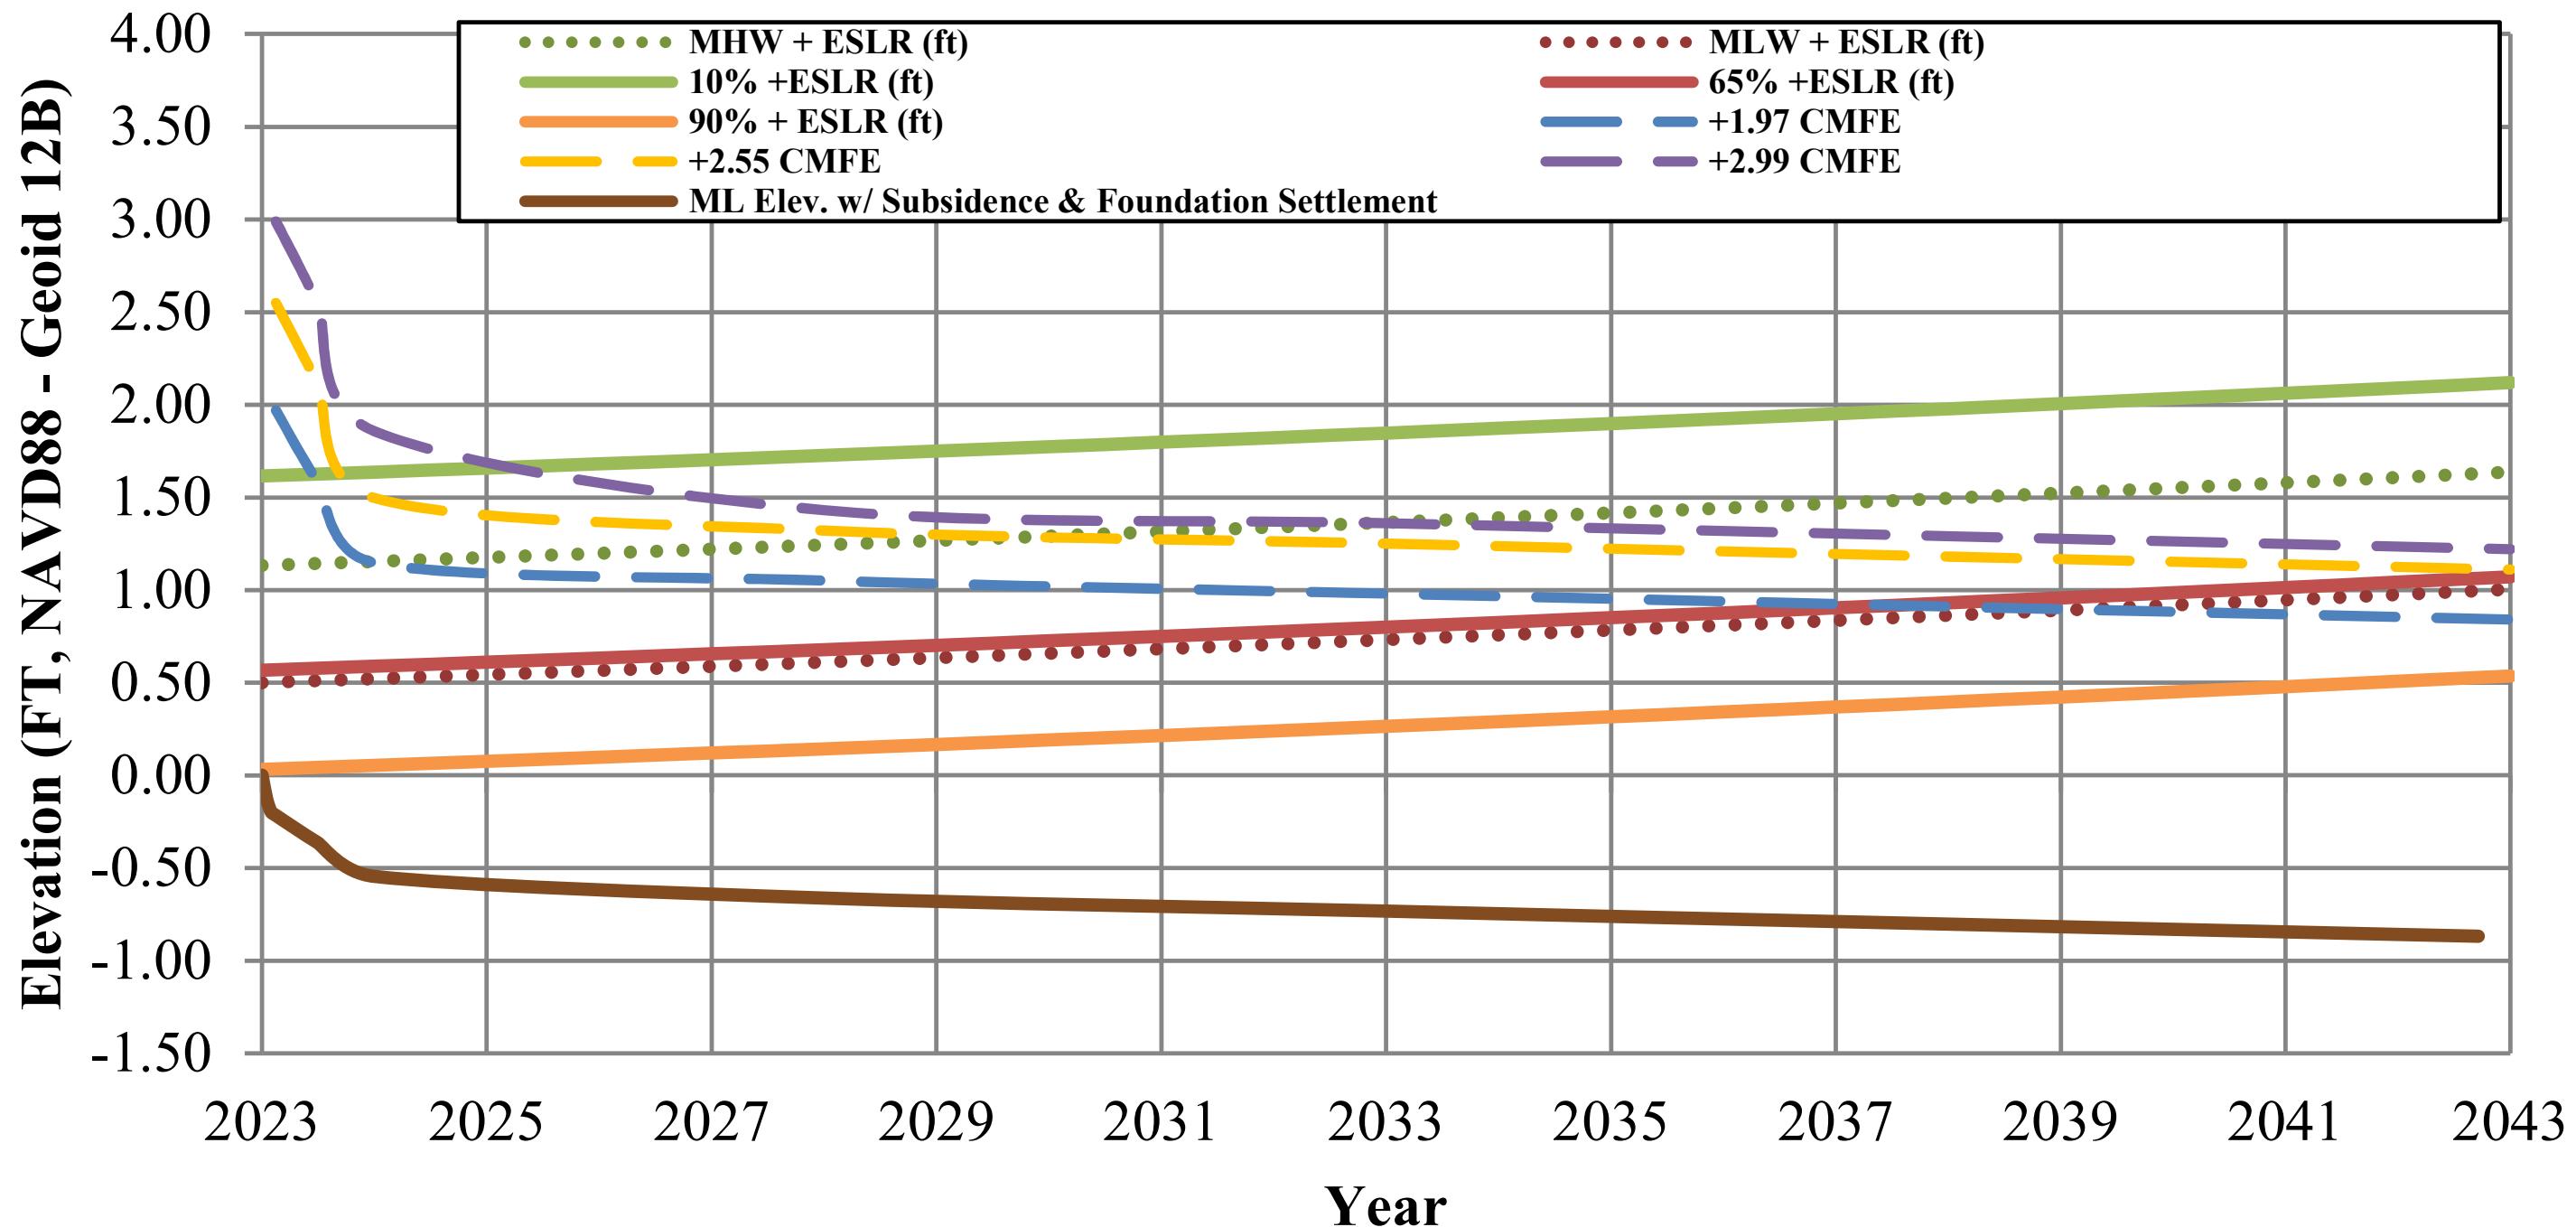

This report has been prepared for the exclusive use of **Coastal Protection and Restoration Authority (CPRA)** and their design/construction team associated to this specific project.

NOTE:

1. Preconsolidation Pressure
2. Compression Index
3. Recompression Index
4. Measured as per ASTM D854

BRETON LAND BRIDGE MARSH CREATION (WEST)

COMBINED MCA's WET UNIT WT. - shear line

Settle3D Analysis Information

Breton Landbridge Marsh Creation

Project Settings

Document Name	mca 1 ECD
Project Title	Breton Landbridge Marsh Creation
Analysis	MCA - 1 ECD
Date Created	5/10/2021, 12:56:15 PM
Stress Computation Method	Boussinesq
Time-dependent Consolidation Analysis	
Time Units	years
Permeability Units	feet/year
Minimum settlement ratio for subgrade modulus	0.9

Use average properties to calculate layered stresses

Improve consolidation accuracy

Ignore negative effective stresses in settlement calculations

Stage Settings

Stage #	Name	Time [years]
1	Stage 1	0
2	Stage 2	0.041
3	Stage 3	0.082

Settle3D Analysis Information

Breton Landbridge Marsh Creation

Project Settings

Document Name	mca 1 Lake Berm
Project Title	Breton Landbridge Marsh Creation
Analysis	MCA - 1
Date Created	5/10/2021, 12:56:15 PM
Stress Computation Method	Boussinesq
Time-dependent Consolidation Analysis	
Time Units	years
Permeability Units	feet/year
Minimum settlement ratio for subgrade modulus	0.9

Include buoyancy effect when material settles below water table

Use average properties to calculate layered stresses

Improve consolidation accuracy

Ignore negative effective stresses in settlement calculations

Stage Settings

Stage #	Name	Time [years]
1	Stage 1	0
2	Stage 2	0.041

Total Settlement vs. Depth

Settle3D Analysis Information

Breton Landbridge Marsh Creation

Project Settings

Document Name	mca 2 & 3 ECD
Project Title	Breton Landbridge Marsh Creation
Analysis	MCA - 2 & 3 ECD
Date Created	5/10/2021, 12:56:15 PM
Stress Computation Method	Boussinesq
Time-dependent Consolidation Analysis	
Time Units	years
Permeability Units	feet/year
Minimum settlement ratio for subgrade modulus	0.9

Use average properties to calculate layered stresses

Improve consolidation accuracy

Ignore negative effective stresses in settlement calculations

Stage Settings

Stage #	Name	Time [years]
1	Stage 1	0
2	Stage 2	0.041
3	Stage 3	0.082

Total Settlement vs. Depth

Project		Breton Landbridge Marsh Creation
Analysis Description		MCA - 2 & 3
Drawn By		Company
Date	5/10/2021, 12:56:15 PM	File Name
		mca 2 & 3 ECD.s3z

Settle3D Analysis Information

Breton Landbridge Marsh Creation

Project Settings

Document Name	mca 2&3 Lake Berm
Project Title	Breton Landbridge Marsh Creation
Analysis	MCA - 2&3 Lake Berm
Date Created	5/10/2021, 12:56:15 PM
Stress Computation Method	Boussinesq
Time-dependent Consolidation Analysis	
Time Units	years
Permeability Units	feet/year
Minimum settlement ratio for subgrade modulus	0.9

Include buoyancy effect when material settles below water table

Use average properties to calculate layered stresses

Improve consolidation accuracy

Ignore negative effective stresses in settlement calculations

Stage Settings

Stage #	Name	Time [years]
1	Stage 1	0
2	Stage 2	0.041
3	Stage 3	0.082

Document Name	mca 4 ECD
Project Title	Breton Landbridge Marsh Creation
Analysis	MCA - 4 ECD
Date Created	5/10/2021, 12:56:15 PM
Stress Computation Method	Boussinesq
Time-dependent Consolidation Analysis	
Time Units	years
Permeability Units	feet/year
Minimum settlement ratio for subgrade modulus	0.9

Use average properties to calculate layered stresses

Improve consolidation accuracy

Ignore negative effective stresses in settlement calculations

Stage Settings

Stage #	Name	Time [years]
1	Stage 1	0
2	Stage 2	0.041
3	Stage 3	0.082
4	Stage 4	0.164
5	Stage 5	0.246
6	Stage 6	0.328
7	Stage 7	0.5
8	Stage 8	1
9	Stage 9	2
10	Stage 10	5

Results

Time taken to compute: 3.90917 seconds

Stage: Stage 1 = 0 y

Total Settlement vs. Depth

<i>Project</i>	
Breton Landbridge Marsh Creation	
<i>Analysis Description</i>	MCA - 4
<i>Drawn By</i>	<i>Company</i>
Date	5/10/2021, 12:56:15 PM
	File Name
	mca 4 ECD.s3z

Settle3D Analysis Information

Breton Landbridge Marsh Creation

Project Settings

Document Name	mca 4 Lake Dike
Project Title	Breton Landbridge Marsh Creation
Analysis	MCA - 1 Lake Dike
Date Created	5/10/2021, 12:56:15 PM
Stress Computation Method	Boussinesq
Time-dependent Consolidation Analysis	
Time Units	years
Permeability Units	feet/year
Minimum settlement ratio for subgrade modulus	0.9

Use average properties to calculate layered stresses

Improve consolidation accuracy

Ignore negative effective stresses in settlement calculations

Stage Settings

Stage #	Name	Time [years]
1	Stage 1	0
2	Stage 2	0.041
3	Stage 3	0.082
4	Stage 4	0.164
5	Stage 5	0.246
6	Stage 6	0.328
7	Stage 7	0.5
8	Stage 8	1
9	Stage 9	2
10	Stage 10	5

Results

Time taken to compute: 3.07147 seconds

Stage: Stage 1 = 0 y
